WEEK 4 · DAY 2

Build a LinkedIn Post Approval Workflow

Assignment | learn. build. operate

1. Problem Statement

You want AI to draft your LinkedIn posts, but nothing should be filed away without your say-so. Build an **n8n** workflow that starts with a **web form** where you type a topic. A **Writer Agent** drafts the post, a **Reviewer Agent** improves it, and the result is emailed to you with **Approve** and **Reject** buttons. The run pauses there until you decide, and only an approved post reaches your **Google Sheet**.

Tools: n8n, Gmail, Google Sheets, an AI chat model

2. Requirements

- Start from an n8n **Form Trigger** with one required field for the topic.
- Two **AI Agent** nodes, each with a chat model: a **Writer Agent** that drafts the post and a **separate Reviewer Agent** that improves it, not one prompt doing both jobs.
- Email the final post to yourself with the Gmail operation that **waits for a response**, so the run pauses until you click **Approve** or **Reject**.
- Branch on that decision with an **IF** node.
- Save **only approved** posts to a sheet with columns `Date | Topic | Final Post | Status`.
- Keep credentials in the n8n credential store; save the workflow as `LinkedIn Post Approval`.

> **Think it through**
>
> A reviewer can only improve what it is allowed to judge. What standards are you giving it, and should it hand back feedback or the rewritten post? Decide too what **Reject** means: drop the post, or leave a record that you turned it down.

3. Steps to complete

These are hints, not the full answer. Work out the exact settings yourself.

Step 1: Build the form

Add an **On form submission** trigger with one required field named `Topic`. Run **Test step** and submit a topic once, so the later nodes have real data to work with.

Step 2: Write, then review

Add two **AI Agent** nodes in a row, each with its own **chat model** underneath. Set **Source for Prompt** to **Define below** on both and pull the previous node's text in with an expression.

```
# Writer Agent
Write a LinkedIn post about: {{ $json.Topic }}
Hook in line one, 120-150 words, one call to action,
max 3 hashtags. Return the post only.

# Reviewer Agent
Score the post below out of 10 on hook, clarity and CTA,
then rewrite its weakest part. Return the final post only.
{{ $json.output }}
```

Step 3: Send it for approval, then branch

Add a **Gmail** node and pick the operation that waits for a reply. Put the reviewed post in the body, address it to yourself, and cap the wait. Follow it with an **IF** node reading the true/false field the approval returns.

```
Operation       : Send message and wait for response
Response Type   : Approval
Limit Wait Time : on - 1 day

IF condition    : {{ $json.data.approved }}  is true
```

Step 4: Save the approved post

Create a Google Sheet with the four columns. In Google Cloud enable the **Google Sheets API** on the same project you made on Day 1, add a Google Sheets credential, then put a **Google Sheets** node on the true branch set to **Append Row** and map each column.

4. Final output

Your wording can differ, but one run should play out like this:

```
1. You submit a topic in the form
2. Writer Agent drafts the post
3. Reviewer Agent rewrites it and returns the final version
4. An email arrives with Approve / Reject - the run waits
5. You click Approve and a row lands in your sheet:
   2026-10-01 | Remote work | <final post> | Approved
   Click Reject instead and nothing is written.
```

5. What to submit

- Screenshots of your workflow canvas, the approval email, and the saved row in your sheet.
- Your workflow exported as JSON and pushed to **GitHub**, with the link shared in **WhatsApp**.
- Your screen-recorded video of the full run, posted in the **community**.
